

Taxidermy Manufacturing & Tracking App – Freelancer Brief

1. Objective

Build a simple, clean system to manage taxidermy jobs from intake to delivery.

The system must:

- Prevent loss or mix-ups of items
- Give clients visibility
- Control workflow stages
- Keep costs low

This is NOT a full ERP or complex CRM.

This is a focused job tracking system.

2. Core Concept

Each client order = ONE PROJECT

Each project can contain MULTIPLE ITEMS:

- horns
- skins
- skulls
- etc.

Everything must be linked to a UNIQUE PROJECT CODE.

3. Core Features (MVP)

3.1 Job Creation (Intake)

- Create project with unique code
 - Add client details
 - Add multiple items per project
 - Upload intake photos
 - Record pre-existing damage
-

3.2 Stage Tracking (Critical)

Each job moves through stages:

Example:

1. Intake
2. Tanning
3. Mounting
4. Finishing
5. Ready
6. Shipped

Requirements:

- Visual status per job
 - Ability to customise stages per job
 - History log of stage changes
-

3.3 Photo Management

- Upload photos at:
 - intake
 - progress
 - shipping
 - Auto compress images
 - Link photos to job + stage
-

3.4 Client Portal

Client must be able to:

- Login
- View job status
- View photos
- Approve work (critical step)
- Download documents

3.5 Approval Step (Important)

- Client must approve pose/manikin
- System must BLOCK progress until approval

3.6 Documents

- Upload permits, contracts, etc.
- Secure per job

3.7 Payments

- Create quote (one per job)
- Track deposit paid
- Send final payment link

3.8 Shipping

- Upload crate photos
- Store waybill number
- Provide tracking link

4. Non-Negotiables

- Simple UI (no clutter)
- Fast to use
- Mobile-friendly
- Low hosting cost
- Scalable later to SaaS

5. What This Is NOT

- Not accounting software

- Not inventory system
- Not full CRM

Keep it lean.

6. Suggested Tech Stack (Open to discussion)

- Backend: Supabase (Postgres + Auth + Storage)
- Frontend: Next.js (web)
- Optional mobile later

Reason:

- Low cost
- Fast build
- Scalable

7. Development Approach

Build in phases:

Phase 1 (MVP):

- Jobs
- Items
- Stages
- Photos

Phase 2:

- Client portal
- Approvals

Phase 3:

- Payments
- Shipping

8. Key Design Principle

This system must feel like:

- A production tracker
- Not a CRM

Focus:

"Where is the job now?"

9. Questions for Freelancer

1. What is the fastest way to build this MVP?
 2. What parts can be reused from existing systems?
 3. How do we design database structure for multi-tenant (future SaaS)?
 4. How do we handle image compression efficiently?
 5. What is the simplest authentication setup?
-

10. Success Criteria

- Can create job in under 2 minutes
 - Can track status instantly
 - Client can view progress without calling
 - No item ever gets lost or mixed
-

11. Final Instruction

Keep everything simple.

Do not over-engineer.

Build only what is necessary for real usage.
